

Answers - Arc length (page ??)

1. $y = 7(6 + x)^{\frac{3}{2}}$ along the interval $[3, 19]$

$$y' = \frac{21}{2}(6 + x)^{\frac{1}{2}}$$

Arc length:

$$L = \int_3^{19} \sqrt{1 + \frac{441}{4}(6 + x)} dx$$

$$L = \int_3^{19} \sqrt{\frac{1325}{2} + \frac{441x}{4}} dx$$

$$L = \left[\frac{2}{3} \left(\frac{1325}{2} + \frac{441x}{4} \right)^{\frac{3}{2}} \times \frac{4}{441} \right]_3^{19}$$

$$L = 686.2$$

2. $y = 1 + 6x^{\frac{3}{2}}$ along the interval $[0, 1]$

$$y' = 9x^{\frac{1}{2}}$$

Arc length:

$$L = \int_0^1 \sqrt{1 + 81x} dx$$

$$L = \left[\frac{2}{3} (1 + 81x)^{\frac{3}{2}} \times \frac{1}{81} \right]_0^1$$

$$L = 6.1$$

3. $y = \frac{3}{2}x^{\frac{2}{3}}$ along the interval $[1, 8]$

$$y' = x^{-\frac{1}{3}}$$

Arc length:

$$L = \int_1^8 \sqrt{1 + x^{-\frac{2}{3}}} dx$$

This is a tricky integral so we will do some manipulation first:

$$\text{Factor out } x^{-\frac{2}{3}}: \sqrt{x^{-\frac{2}{3}}(x^{\frac{2}{3}} + 1)} = x^{-\frac{1}{3}} \sqrt{x^{\frac{2}{3}} + 1}$$

$$\text{Giving us: } \int_1^8 x^{-\frac{1}{3}} \sqrt{x^{\frac{2}{3}} + 1} dx$$

Use a substitution of $u = x^{\frac{2}{3}} + 1$:

$$\frac{du}{dx} = \frac{2}{3}x^{-\frac{1}{3}}$$

$$du = \frac{2}{3}x^{-\frac{1}{3}} dx$$

$$\frac{3}{2} du = x^{-\frac{1}{3}} dx$$

Changing the boundaries:

$$u = 8^{\frac{2}{3}} + 1 = 5$$

$$u = 1^{\frac{2}{3}} + 1 = 2$$

Our integral is therefore:

$$L = \frac{3}{2} \int_2^5 u^{\frac{1}{2}} dx$$

$$L = \frac{3}{2} \left[\frac{2}{3} u^{\frac{3}{2}} \right]_2^5$$

$$L = 8.34$$

4. $x = \frac{1}{3}(y^2 + 2)^{\frac{3}{2}}$ along the interval $0 \leq y \leq 4$

$$x' = y(y^2 + 2)^{\frac{1}{2}}$$

Arc length:

$$L = \int_0^4 \sqrt{1 + y^2(y^2 + 2)} dy$$

$$L = \int_0^4 \sqrt{1 + y^4 + 2y^2} dy$$

$$L = \int_0^4 \sqrt{(y^2 + 1)^2} dy$$

$$L = \int_0^4 (y^2 + 1) dy$$

$$L = \left[\frac{y^3}{3} + y \right]_0^4$$

$$L = \frac{76}{3} = 25\frac{1}{3}$$

5. $x = \frac{1}{3}\sqrt{y}(y - 3)$ along the interval $1 \leq y \leq 9$

$$x = \frac{1}{3}y^{\frac{3}{2}} - y^{\frac{1}{2}}$$

$$x' = \frac{1}{2}y^{\frac{1}{2}} - \frac{1}{2}y^{-\frac{1}{2}} = \frac{\sqrt{y}}{2} - \frac{1}{2\sqrt{y}}$$

$$(x')^2 = \frac{y}{4} - \frac{1}{2} + \frac{1}{4y}$$

Arc length:

$$L = \int_1^9 \sqrt{1 + \left(\frac{y}{4} - \frac{1}{2} + \frac{1}{4y}\right)} dy = \int_1^9 \sqrt{\frac{y}{4} + \frac{1}{2} + \frac{1}{4y}} dy$$

$$L = \int_1^9 \sqrt{\left(\frac{\sqrt{y}}{2} + \frac{1}{2\sqrt{y}}\right)^2} dy = \int_1^9 \left(\frac{\sqrt{y}}{2} + \frac{1}{2\sqrt{y}}\right) dy$$

$$L = \left[\frac{1}{3}y^{\frac{3}{2}} + y^{\frac{1}{2}} \right]_1^9$$

$$L = \frac{32}{3} = 10\frac{2}{3}$$

6. $y = \ln(\cos x)$ on the closed interval $0 \leq x \leq \frac{\pi}{3}$

$$y' = \frac{1}{\cos x} \times -\sin x = -\tan x$$

Arc length:

$$L = \int_0^{\frac{\pi}{3}} \sqrt{1 + \tan^2 x} dx$$

$$L = \int_0^{\frac{\pi}{3}} \sec x dx$$

To integrate $\sec x$ we need to multiply by $\frac{\sec x + \tan x}{\sec x + \tan x}$, giving us:

$$L = \int_0^{\frac{\pi}{3}} \frac{\sec^2 x + \sec x \tan x}{\sec x + \tan x} dx$$

This is in the form $\frac{f'(x)}{f(x)} dx$, therefore integrates into $\ln f(x)$.

Therefore, the result is:

$$L = \left[\ln (\sec x + \tan x) \right]_0^{\frac{\pi}{3}}$$

$$L = [\ln (2 + \sqrt{3}) - \ln (1 + 0)] = \ln (2 + \sqrt{3}) = 1.32$$
